Data Cleaning: I collected anime data from the MyAnimeList API and saved the initial raw dataset. Then I cleaned and preprocessed the data by removing duplicates, converting numeric fields to the correct format, dropping rows with missing key values, handling inconsistent text formatting, extracting genre and studio names from nested fields, and filtering out unrealistic outliers such as invalid ratings or episode counts. I also removed the “ID” tags from the studio and genre column for a more cleaned perspective. The code for the cleaned dataset will be on our github and will generate a cleaned csv file.

Exploratory and Statistical Analysis:

By analyzing the top 1000 anime ranked by rating, there is a clear trend that anime is growing year by year. Although there are some outliers, such as 2015 being a particularly high year of growth and 2020 being relatively low. The number of anime in the top 1000 for 2026 is low for now because the year is not over yet, and more anime are still being released. Counting by most popular genres in the top 1000 anime, it is relatively close together. The most popular anime genres, listed in order, are action, drama, shounen, and then there is a drop of more than 50 to the fourth place, comedy. From there, it is a gradual tapering off of anime in each genre.

Summary statistics for important variables (e.g., averages, ranges, counts):

Using the cleaned data we found a few important variables. Information includes the number of rows and columns in the dataset, the data types for each column using 'dtypes', summary statistics and ranges for all numerical columns using `df.describe()` and a for loop to calculate range. Numerical columns include the number of episodes each anime has, rating, rank, popularity, and year. Some other useful information that was gathered was the highest ranking anime, the average rating of animes each, and the amount of anime released each year.

Story:

Prior to this project, we had a feeling that anime was becoming more popular and mainstream.

By using MAL's api we found that anime is getting more popular as time goes on, as well as other questions, such as what are the most popular genres of anime?
